ON THE REPRESENTATIONS OF $xy + yz + zx$

JONATHAN BORWEIN AND KWOK-KWONG STEPHEN CHOI

Abstract. We show that there are at most 19 integers that are not of the form $xy+yz+xz$ with $x, y, z \geq 1$. Eighteen of them are small and easily found. The remaining possibility must be greater than 10^{11} and cannot occur if we assume the Generalized Riemann Hypothesis.
